

Problem

You are given a directed flow network consisting of V vertices and E directed edges. Each edge has a capacity that represents the maximum amount of flow that can pass through it.

The source vertex is 0 and the sink vertex is $V-1$.

Submissions

Your task is to find the maximum possible flow from the source to the sink using the Ford—Fulkerson algorithm.

Input Format

The first line contains two space-separated integers: V — number of vertices E — number of directed edges Each of the next E lines contains three space-separated integers: u — starting vertex v — ending vertex capacity — capacity of the edge

Constraints

$2 \leq V \leq 100$ $1 \leq E \leq 1000$ $0 \leq u, v < V$ $u \neq v$ $1 \leq \text{capacity} \leq 10^6$

Output Format

Print a single integer representing the maximum flow from vertex 0 to vertex $V-1$.

Sample Input 0

```
6 9
0 1 16
0 2 13
1 2 10
2 1 4
1 3 12
3 2 9
2 4 14
4 3 7
3 5 20
```

Sample Output 0

```
19
```

Language

Python 3

```
1 from collections import deque
2 V, E = map(int, input().split())
3 cap = [[0]*V for _ in range(V)]
4 for _ in range(E):
5     u, v, c = map(int, input().split())
6     cap[u][v] += c
7 ans = 0
8 while True:
9     p = [-1]*V
10    p[0] = 0
11    q = deque([0])
12    while q and p[V-1] == -1:
13        u = q.popleft()
14        for v in range(V):
15            if p[v] == -1 and cap[u][v] > 0:
16                p[v] = u
17                q.append(v)
18    if p[V-1] == -1:
19        break
20    f = 10**9
21    v = V-1
22    while v:
23        u = p[v]
24        f = min(f, cap[u][v])
25        v = u
26    v = V-1
27    while v:
```
