

Problem

Trie is an efficient information retrieval data structure. Use this data structure to store Strings and search strings. Your task is to use TRIE data structure and search the given string A. If found print 1 else 0.

Input Format

N=8 key[]={the,a,there,answer,any,by,bye,their} search=the

Constraints

Expected Time Complexity: $O(M+|search|)$. Expected Auxiliary

Space: $O(M)$. M = sum of the length of all strings which is present in the key[]

|search| denotes the length of the string search

$1 \leq N \leq 104$ $1 \leq |\text{input strings}|, |A| \leq 100$

Output Format

1

Sample Input 0

8
the,a,there,answer,any,by,bye,their

Language

Python 3

```
1 class Node:
2     def __init__(self):
3         self.child = {}
4         self.end = False
5     root = Node()
6     def insert(word):
7         temp = root
8         for ch in word:
9             if ch not in temp.child:
10                 temp.child[ch] = Node()
11             temp = temp.child[ch]
12         temp.end = True
13     def search(word):
14         temp = root
15         for ch in word:
16             if ch not in temp.child:
17                 return 0
18             temp = temp.child[ch]
19         return 1 if temp.end else 0
20     n = int(input())
21     words = input().split(",")
22     s = input()
23     for word in words:
24         insert(word)
25     print(search(s))
```
